ANNA'S BEAUTISTRY

The Roadmap

Everything between a beautiful site and a business that gets booked.

Who · Me = I do it You = needs your login or decision Both = I walk you through it

Size · S = under an hour M = a few hours L = a day or more

Right now — what's waiting on you

From the other working chat, which built the booking backend, `/admin`, `/gallery` and the new hours/footer. **That work is on a different branch and is not merged.** This branch contains none of it — I checked.

- ME · S **The booking database is alive.** Confirmed 24 Oct: `annas-beautistry`, ref `ueoowlqruzbjtgcxvxzp`, three tables, 20 services seeded, locked down properly. The earlier "the database has gone" scare was a stale connection, not a lost project.
- YOU · S **Anna sets her own admin password.** Supabase → Authentication → Users → `annasbeautistry@gmail.com` → **Reset password**. She chooses a password only she knows — I can trigger the reset, but I can't and shouldn't choose it for her. Then she signs in at `/admin`. **Two things must be true first:** the site branch is merged (so `/admin` exists on the live site) and the auth `site_url` is off `localhost` — otherwise the reset link opens a dead address.
- BOTH · S **Live test: Anna blocks a Busy period.** Once she's signed in, she marks one afternoon as busy, and I check the public booking form refuses that slot. This is the first end-to-end proof the backend works with a human at the controls — worth doing before anything else gets built on top of it.
- YOU · S **Google Maps pin** for the exact studio spot — I will point the Location card at it precisely.
- YOU · L **Real gallery photos** — `/gallery` still shows ten placeholders.
- ME · S **Open the pull request into** `main` when you say so. Everything so far, this roadmap included, sits unmerged until then.
- ME · S **Revoke public execute on two trigger functions.** `rls_auto_enable` (elevated rights) and `set_booking_updated_at` are callable from a browser via `/rpc/`. Harmless today, but they should not be reachable at all. One line each.
- ME · M **Ownership check on payment endpoints.** `submit_partial_payment_reference` accepts any `booking_id` and flips the status to "payment submitted". UUIDs are unguessable so the practical risk is low, but anyone holding a booking id (screenshot, shared link) could submit a reference for someone else's booking. Fix: issue a secret token with the hold and require it on both endpoints.
- BOTH · S **Reconcile the deposit.** The schema takes a 30% deposit and sets status `pending_partial_payment`; the site copy still promises "no payment taken here". One of the two must change before a customer sees both on the same page.
- ME · S **Set the auth** `site_url`**.** It is still `http://localhost:3000`, so password-reset emails point at a machine that does not exist. Set it when the domain is live.

THE TWO-BRANCH PROBLEM — READ BEFORE MERGING

Two unmerged branches exist now: this one (roadmap only) and the one holding the site work. Merging both can conflict, and a conflict in `main` is much worse than a delay. Simplest order: **merge the site work first**, then I rebase this roadmap onto it. Tell me which you want; do not merge them blind.

Phase 0 — Decisions and accounts (no code)

- YOU · S Confirm the **domain**: buy `annasbeautistry.com` in your own name (~$12/yr), or launch on the free `*.vercel.app` address first.
- YOU · S Confirm `hello@annasbeautistry.gh` **actually receives mail** — the site prints it in the footer and nav. If not, use a real inbox (Gmail is fine) or remove it.
- YOU · S **Get Anna's mobile number.** Bookings route to her WhatsApp, and the number on the site (`+233 33 213 0455`) is a Cape Coast **landline** — landlines cannot receive WhatsApp. Needs a `+233 2x/5x` mobile, with WhatsApp actually on it.
- YOU · S Decide which of the two numbers goes on the site: a clickable WhatsApp link, or the landline for calls. Both is fine; a `wa.me` link pointing at a landline is not.
- BOTH · S **Re-authorise Vercel** — the current token can read the account but not a single project (both `projects` and `deployments` return Access denied).
- BOTH · M **Create the Supabase project** in *Kaly06's Org* — region `eu-west-1`.

Done 24 Oct — `annas-beautistry`, ref `ueoowlqruzbjtgcxvxzp`, healthy, Postgres 17.

- YOU · S Decide whether the **free Vercel plan** is acceptable until revenue covers ~$20/mo (it is, for a small studio site — see "The honest risks").
- YOU · S Decide **whether to take payments**: nothing at booking (today's promise), or a refundable deposit later. Nothing in Phase 2 depends on it.

Who owns what

It is **Anna's business**, so the things that carry her reputation go in her name. The rest can be held by whoever builds it, and handed over.

Thing	Name on it	Why
Domain	**Anna**	Her name, her card. Never a developer's account.
`hello@annasbeautistry.com`	**Anna**	Clients are writing to *her*.
Google Business Profile	**Anna**	Verification needs her; reviews attach for good.
WhatsApp number	**Anna's mobile**	Already exists, already checked hourly.
Vercel / GitHub / Supabase	Either	Add Anna as a member at handover.
Notion	**Nobody yet**	Optional. Do not create an account just to hold bookings.

Handover is a real step, not an afterthought: transfer the domain, add her as project owner, move the recovery email to hers.

Phase 1 — Make it real (get it live, correctly)

Right now the site has never been hosted. Everything below is what breaks the first time it is.

- ME · M `vercel.json` **with SPA rewrites.** Without it, `/services/wigs` works when clicked and **404s on refresh** or when shared. This is the single most common way a site like this embarrasses itself.

- ME · S Connect the repo to Vercel, framework preset *Vite*, output `dist`, install `npm ci`.
- ME · S **Preview deploys per pull request** — every change gets its own URL to look at before it goes live.
- ME · S Environment variables: `VITE_SUPABASE_URL`, `VITE_SUPABASE_ANON_KEY`, on Production **and** Preview.
- ME · S **A real 404 status** — the pretty `NotFound` page must return HTTP 404, not 200, or Google indexes your error page.
- ME · S Confirm `robots.txt` **doesn't block the whole site** by accident (it currently doesn't exist at all).
- ME · S **Cache headers** for `/images/*` and hashed assets — faster repeat visits, free.
- ME · S Check the site over a slow 3G connection and a mid-range Android, not just a laptop.
- ME · M **Fix the placeholder social links.** The footer points Instagram, Facebook and Twitter at `instagram.com`, `facebook.com`, `twitter.com` — dead ends for anyone who taps them.
- YOU · S Give me the **real social handles**, or say "remove them" (two real links beat three fake ones).

Phase 2 — Make it save bookings (the actual missing piece)

> **Status note.** On *this* branch `Booking.tsx` still calls `setSent(true)` and discards the details. > The other branch has a real backend, `/admin` and migrations — but its Supabase project has gone, so > that work cannot run either until the project is restored. Treat the items below as the checklist for > verifying that branch once it is live again, not as unbuilt work.

Database

- ME · M **Tables. Done 24 Oct**, built by the frontend branch and applied as three migrations:

`bookable_services` (20 rows seeded), `bookings` (22 columns), `studio_closures`. Plus functions `create_booking_hold`, `get_busy_slots`, `get_booking_payment_status`, `submit_partial_payment_reference`. Note: the shape differs from what this line originally specified — it is better, and the code matches it. `bookable_services` holds the menu, so `treatments` / `wig_options` were folded into one table + jsonb.

- ME · S **Row-Level Security. Done 24 Oct.** RLS on for all three tables. `bookings` deliberately has

no policies — the public key is visible in every browser, so a raw insert policy would let anyone script fake bookings at invented prices. Bookings go through the `SECURITY DEFINER` function instead, which re-checks service, price, hours, overlaps and closures server-side. Verified: all four functions are `SECURITY DEFINER` with `search_path` pinned.

- ME · S `service_role` **stays out of the bundle. Confirmed 24 Oct** — only the publishable key is used.
- ME · S `amount_minor` + `currency` stored as *two* columns. The studio prices in **GH₵**; your Notion Finance HQ is in **AED**. Never mix them silently.

The form

- ME · M Wire the form to Supabase, with a **real error state** ("we didn't get that — call us on …") instead of a fake success.
- ME · S **Fallback:** if env vars are missing or the database is down, the form falls back to a `wa.me` link carrying the details prefilled. A booking never silently dies.
- ME · S No invented success. The "we'll reply within 24 hours" copy only shows after the row actually writes.
- ME · S **Validate properly:** reject past dates, sanity-check the Ghana phone format, cap `notes` length.
- ME · S **Spam protection** without a captcha (honeypot field + rate limit). Captchas cost bookings.

- ME · M **Timezone honesty:** store `Africa/Accra` deliberately, don't trust the browser's clock.
- ME · S Store the **service slug and room**, not a display name — so a reworded treatment doesn't orphan old bookings.

After the booking Decided — where a booking goes: Anna's **WhatsApp first**, **email as backup**. No dashboard for her to remember to open.

- ME · M **WhatsApp handoff:** after saving, offer a one-tap "message us now" link with the booking summary prefilled. The copy already promises WhatsApp — the site currently has **no WhatsApp link anywhere**, which is the biggest contradiction in it.
- ME · M **Email backup** to `hello@annasbeautistry.com` (Supabase edge function + Resend free tier), so a booking still reaches her if WhatsApp is down, the site is idle, or a phone is lost.
- ME · S **The bookings page you read** — via Notion (Phase 4), not a custom admin panel. Cheaper, and you already know the tool.

Phase 3 — Be found (SEO, in the order that actually pays)

- YOU · M **Google Business Profile** — claim, verify, add hours, photos, and the booking link. This is what puts you in the map box; the website alone cannot.
- ME · M **Per-page titles and descriptions.** No page sets its own today (`grep document.title` → nothing), so Google sees the homepage title for *every* treatment page.
- ME · S **Per-page social tags** — for the same reason, plus the share preview below.
- ME · M **Fix the WhatsApp preview.** `og:image` is `/images/hero.webp` — a relative path in a format WhatsApp handles poorly, so a shared link likely shows a bare, photo-less card. Needs a 1200×630 JPEG at an absolute URL.
- ME · S `sitemap.xml` + `robots.txt` pointing at it.
- ME · S `LocalBusiness` **structured data** — address, hours, phone, price range — for the info box in search results.
- ME · S `apple-touch-icon` and a small `manifest.webmanifest`, so it saves to a phone home screen looking deliberate.
- ME · S Canonical URLs, and make sure the bare domain and `www` don't both serve the site.
- YOU · L **Ask ten happy clients for a Google review.** Nothing I can code moves local ranking as much. Slow, free, decisive.
- YOU · S Get the business listed on the places Ghanaians actually search: Instagram bio link, Google Maps, any local directory.

Phase 4 — Make the content true

- YOU · L **Real studio photography.** `public/images` are placeholders — the README says so. Hero and the four room cards first; the 19 service images can follow.
- YOU · S **The real logo.** `HOUSE.logoSrc` is `null`; the site falls back to the typographic lockup. Drop a transparent SVG/PNG in and set the path.

- YOU · M **Verify every price and duration** in `menu.ts` (19 treatments) and `wigOptions.ts` (8 decision groups). Illustrative figures shipping to real customers is worse than no figures.
- YOU · M **Verify the testimonials** in `services.ts` are from real clients, with permission. Invented quotes on a small business site are a real risk.
- YOU · S Check the **hours** (`Tue–Sat · 9am–7pm`), address, and founding year (2016).
- ME · S **Privacy note** — bookings are personal data. Ghana's Data Protection Act (Act 843) expects you to say what you collect and why. One honest page, linked from the form.
- ME · S A **cancellation / deposit policy** page if you take money later. Agreeing this after a dispute is much harder.

Phase 5 — Run it without me

- BOTH · M **Optional — Notion cockpit.** `Studio Bookings` (mirrored from Supabase, one-way) and monthly totals posted into Finance HQ. **Not needed for launch:** bookings already land in Anna's WhatsApp and email, and a dashboard she has to remember to open is a step backwards. Build it only if she asks for "one list of all my bookings".
- BOTH · S **Linear:** project "Anna's Beautistry", the Phase 1–3 items as issues, GitHub integration on, PR preview URLs attached to their issue.
- ME · S **Analytics** — something privacy-friendly and free (Vercel Analytics or Plausible). You need to know whether *anyone* is visiting before you spend on anything else.
- ME · S **Backups:** a monthly CSV export of `bookings` to your own drive. Free databases do not owe you a backup.
- ME · S **Uptime check** on the site and a wake-up ping for Supabase, so the week-long nap never reaches a real customer.
- YOU · S Know the two alarms: Supabase paused (click Restore), and domain renewal (do not let it lapse).

Phase 6 — Later, once it earns

Not now. Listed so the design doesn't foreclose them.

- **Deposits / payments** — Paystack handles cards and Mobile Money in Ghana. Only after bookings justify the fee and the refund policy exists.
- **Multiple staff / chairs** — calendar per stylist; a real scheduling model, not just a list of requests.
- **Retail** — selling wigs or aftercare online needs stock, shipping and tax. A different business, not a different page.
- **Blog / looks journal** — the cheapest long-term SEO, if someone will actually write it.
- **Bilingual** — English/Fante, if the audience wants it.

The honest risks

- **Vercel's free plan** is meant for personal projects. Realistic outcome for a small studio site: an email suggesting you upgrade. Not: deletion, or a surprise bill. **Your code lives on GitHub**, so moving hosts is an afternoon, not a rescue.
- **Supabase free pauses after ~a week of no use**, and a booking submitted while asleep is lost. Phase 2's `wa.me` fallback and Phase 5's wake-up ping both exist for exactly this.
- **The domain is the one that bites.** Let it lapse and someone else can buy your name. Keep it paid, in your name.
- **Nothing here needs a card to start.** If any screen demands one, stop and ask me.

The shortest path to a customer actually booking

If everything else waits, do these six:

1. `vercel.json` rewrites → the site survives a refresh.
2. Supabase project + `bookings` table + RLS.
3. Form writes the row; `wa.me` fallback behind it.
4. Real social links, or none.
5. Google Business Profile claimed.
6. Share preview fixed.

That is a working, findable, honest site — and everything else on this page is polish.
